About JPDM

Journal of Proteome Data and Methods

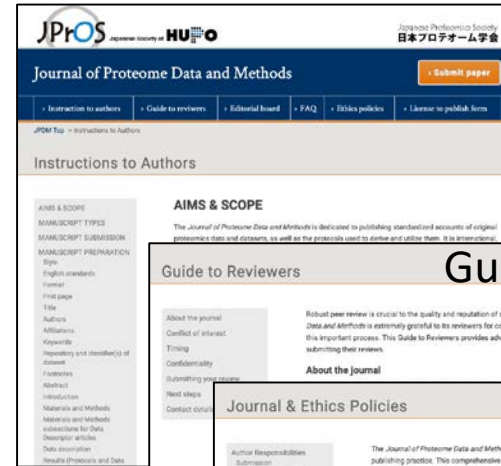

Proteomics is a rapidly growing research area that produces large amounts of data, which has led to complex challenges around data management. Proteomics data and datasets need to become more interoperable, discoverable and trusted, and therefore better used, re-used and more valuable. To address these challenges and facilitate better proteome data management, the field needs to develop formal structures and procedures. To this end, the Japanese Proteomics Society (JPProS) is proposing to launch a new journal – **the Journal of Proteome Data and Methods**.

Instructions to Authors

AIMS & SCOPE

The Journal of Proteome Data and Methods is dedicated to publishing standardized accounts of original proteomics data and datasets, as well as the protocols used to derive and utilize them. It is transitional.

Guide to Reviewers

Robust peer review is crucial to the quality and reputation of scholarly journals. The Journal of Proteome Data and Methods is extremely grateful to its reviewers for contributing their time, effort and expertise to this important process. This Guide to Reviewers provides advice for reviewers on preparing and submitting their reviews.

Journal & Ethics Policies

The Journal of Proteome Data and Methods upholds the highest standards regarding research and publishing practices. This comprehensive suite of policies covers the main responsibilities of the journal's authors, reviewers, editors and owner.

From Bench to Internet: Sharing Proteomics Data and Methods through the Open Access Journal

This is an open access article under the CC BY license (<http://creativecommons.org/licenses/by/4.0/>).

Proteomics is a rapidly growing research area relating to all of bioscience fields. Advances in proteomics technologies including mass spectrometry (MS) coupled with bioinformatics had opened the way to produce large amounts of data from the entire protein complement of a cell, tissue, or organism etc. under the several set of conditions. Now, these advances have given us complex challenges around data management. Proteomics data and datasets coupled with detailed metadata need to become more **Findable, Accessible, Interoperable, and Re-usable** to promote data sharing in the scientific community. To address these challenges and facilitate better proteome data management, the field needs to develop formal structures and procedures to be an applicable standard. To this end, the Japanese Proteomics Society (JPrOS) decided to launch a new data journal – the **Journal of Proteome Data and Methods (JPDM)**.

JPDM is a peer-reviewed, fully open access and online only journal, provided via the J-stage platform. **JPDM** publishes four article types: “**Data descriptors**”, “**Protocols**”, “**Data processing notes**”, and “**Reviews**”. The main content of the journal is “**Data descriptors**,” in which pure descriptions of data, i.e., detailed metadata on the samples to be analyzed, the sample preparation methods, MS measurement and the data analysis are provided, not the functional data for attempting to address hypotheses or for providing novel scientific interpretation and insight. We ask authors to fill in a **dataset summary table** to provide the basic information on their data and to show why the data described in the JPDM article is of value to the greater scientific community. These requirements make datasets searchable with easy way and consequently more useful to others. **JPDM** tightly collaborates with Japan Proteome Standard Repository/Database (**JPOST**), one of the partner repositories in ProteomeXchange consortium (**PX**). When data producers deposit their datasets in **JPOST** repository then post detailed metadata in **JPDM**, the journal sends a feedback to the **PX** repository. **JPDM** contributes to add a value for proteome datasets by providing detailed metadata. Since **JPDM** is a data journal that accepts only metadata, the biological outputs can still be posted to ordinary journals.

In addition to **Data descriptors**, articles in other three categories (**Protocols, Data processing notes, and Reviews**) highlight and share the experimental protocols and the computational tools that may have never left the lab, or that normally goes unnoticed in supplementary files.

Now, **JPDM** can accelerate the visibility of all kinds of data, protocols and tools in the field of proteomics.
